FULGOROIDEA
CIXIIDAE

INTRODUCTION

The present catalogue of the family Cixiidae forms Part 2 of Fascicle IV of the General Catalogue of the Hemiptera of the world, which is devoted to the superfamily Fulgoroidea.

CHARACTERS OF THE FAMILY

The family Cixiidae is one of the larger families of the Fulgoroidea. It contains 84 genera and 786 species. They are, for the most part, medium or medium small fulgorids. The head is not elaborately developed as it is in many fulgorids but is relatively simple, with simple two-joined antennae each of which has a terminal flagellum. In the tribe Bothriocerini the antenna is sunk into a pit or the head is provided with sub-antennal processes. The third or median ocellus is often present. Tegulae are present. The wings are usually macropterous and the venation is quite characteristic; subcosta, radius, and media are generally united into a common stem from the basal cell, with the stem of subcosta and radius long or short; typically, the branches of subcosta form a nodal cell; radius and media have a few branches, therefore only a small number of antepical and apical cells are formed; the claval suture is distinct; the claval veins unite into a claval stem which ends in the commisural margin. The legs are usually simple; the hind tibiae are long, either without or with only a few lateral spines; characteristically there is a circle of apical spines at the apex of the hind tibia. In the male genitalia: the pygofer is usually bulky with the anal segment large and the anal style reduced; the genital styles are generally large, flat and thin; the aedeagus consists of a simple tube, often divided into two segments. The ovipositor is either complete or reduced.

CLASSIFICATION ADOPTED

The classification adopted in this catalogue is the one proposed by Muir in 1925. Muir recognized 90 genera distributed into two tribes as tabulated below:

Family **CIXIIDAE** Spinola
Tribe **Cixiini** Muir
Tribe **Bothriocerini** Muir

HISTORICAL RÉSUMÉ

The earliest European systematic entomologists recognized the common species in this group, and Linné, Fabricius, De Geer, Olivier and others gave names to well known European species under the genera Cicada and Fulgora. The family was not recognized as a group until it was described under the name Cixiodes by Spinola in his "Essai sur les Fulgorelles" in 1839. Walker and Stål described numerous genera and species from various parts of the world.

In Europe, Fieber, Scott, Edwards, Sahlberg, Buckton, Melichar, Oshanin and others described and catalogued various genera and species of this family. In the Americas, there have been numerous papers by Ball, Berg, Blanchard, Uhler, Van Duzee, Fowler, Metcalf, Dozier and others.

The species and genera from the other parts of the world have been studied and described by White, Atkinson, Kirby, Melichar, Matsumura, Kirkaldy, Hutton, Distant, Jacobi, E. Schmidt, Schumacher, Bergevin, Haupt, Osborn, Muir, Myers, Lallemand, Hesse, and Kusnezov.

GEOGRAPHICAL DISTRIBUTION

The 786 species of this family are widely distributed in all regions of the world save the extreme Arctic and Antarctic regions. The faunas of Europe, North America, Central America, Hawaiian Islands, Japan, India and New Zealand are fairly well known, but vast regions of the world have hardly been explored.

FORM OF THE PRESENT CATALOGUE

This catalogue follows the general form of the present series. The family is divided into tribes, and the genera are arranged under the tribes in as near a phylogenetic order as our present knowledge will permit. The species are arranged under the genera in an alphabetic sequence. All references have been checked against the original save those marked with an asterisk (*), which have been accepted from reliable sources. Every effort has been made to have the references full and complete and to give an indication of the character of the data contained. Where reprints have been published with different pages these pages are inserted in parenthesis following the pages of the original. In a few cases where the matter has been reprinted under a different title with different pages separate references are given. Where authentic editions have been published these have been indicated by separate references. Genera established without included species have been dated from their original description with their type fixation from the date of the first included species. Original spellings have been retained in all cases, except obvious typographical errors; and the original termination of specific names has been retained regardless of the termination of the generic name under which the species is at present located. The species have also been listed under every known combination so that it is possible to find any species without recourse to the index which will be published at the completion of the fascicle, together with the full bibliography.

A catalogue is not a revision of a group and the location of the genera and species in the present catalogue is merely an attempt to reflect what is believed to be the general consensus of the best authorities at the present time. Doubtful genera and species have been included to call them to the attention of subsequent revisers.
