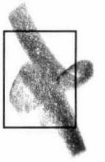
Initial when Updated to Found:



The Genus Cercospora in Indonesia

By K. B. Boedijn, 's Gravenhage

With plates 108 (1) – 111 (4)

Introduction

The genus *Cercospora* is one of the largest genera of the family *Dematiaceae*. It consists entirely of obligatory parasites on vascular plants. The species are limited in their host range; some are even restricted to a single host-species. Furthermore on one and the same host, more than one species of *Cercospora* may sometimes be found. A well known example is furnished by *Arachis hypogaea*, which often harbours at the same time *Cercospora personata* and *Cercospora arachidicola*.

Especially in the tropics, owing to the presence of a very large number of different vascular plants, do we encounter most of the representatives of the genus *Cercospora*.

Up to now only 23 species were mentioned for Indonesia. At present I can list 90 species of *Cercospora* and I am convinced, that this number may be easily increased in the future.

In the next account, the species are listed under the host-families, which are alphabetically arranged.

The following abbreviations have been used for collector names, viz. B. = Boedijn, R. = Raciborski.

ACANTHACEAE

Cercospora rhinacanthi v. Höhnel, Sitzungsber. k. Akad. Wiss. Wien 121, 414, 1912.

Syn.: *Cercosporina rhinacanthi* (v. Höhnel) Sacc., Syll. Fung. 25, 917, 1931.

on *Rhinacanthus* spec., *Rhinacanthus nasutus*.

Java, Hortus Bogoriensis 1907 v. Höhnel, Bogor Aug. 1949, Jan. 1950 B.

CERCOSPORA THUNBERGIAE Boedijn nov. spec. (fig. 1)

Maculae irregularis vel angulatae et venulis limitatae, obscure brunneae, 2–6 mm. longae. Caespituli hypophylli. Stromata minuta vel nulla. Conidiophora laxe sparsa vel fasciculata, pallide olivaceo-brunnea haud, septata et geniculata ad apicem subtruncata 5–30×2–3 μ. Conidia subhyalina,

anguste obclavata, recta vel leniter curvata, spurie multiseptata, ad basim subtruncata ad apicem acuta 49–94×2–3 μ plerumque 64–72×2½ μ.

Leafspots dull brown to sepia, irregular, often angular and vein bound, 2–6 mm. long. Fruiting especially hypophyllous. Stromata slight or none. Conidiophores as short branches spaced at rather short intervals and in bundles on procumbent threads, pale brown, not septate nor geniculate, tip subtruncate 5–30×2–3 μ. Mycelial threads pale grayish brown to subhyaline, branched, septated 1½–3 μ broad.

Conidia subhyaline, acicular, straight to slightly curved, indistinctly multiseptate, base obconic, tip acute 49–94×2–3 μ, mostly 64–72×2½ μ.

On *Thunbergia alata.*

Java, Hortus Bogoriensis April 1950 B.

ANACARDIACEAE

Cercospora mangiferae Koorders, Verh. k. Akad. Wetensch. Amsterdam 13, 236, 1907.

on *Mangifera foetida* and *Mangifera indica.*

Java, Hortus Bogoriensis March 1950, May 1950 B. Purworedjo, Kedu Sept. 1905 Koorders.

This is a somewhat aberrant *Cercospora* species. The color of the conidia is rather dark and almost reddish brown, a hue not observed in other species. Moreover under ordinary high power of the microscope, the walls appear double. According to Chupp (5) this would exclude it altogether from our genus. As it is difficult to find another genus for our species, it may for the present remain in *Cercospora.*

APOCYNACEAE

Cercospora plumeriae Chupp, Mon. Fungus genus Cercospora p. 49, 1953.

on *Plumeria acuminata.*

Java, Bogor July 1949 B. Hortus Bogoriensis July 1950 B.

ARACEAE

Cercospora amorphophalli Henn., Hedwigia 41, 147, 1902.

on *Amorphophallus* spec. and *Amorphophallus variabilis.*

Java, Bogor Dec. 1901 Zimmermann, Hortus Bogoriensis Jan. 1950 Tojib Hadiwidjaja, May 1950 B. Tjianten Jan. 1932 B.

Leafspots in our material brown, 15 mm. long, by coalescing often much longer. Conidia 72–122×3½–4 μ.

Cercospora colocasiae Chupp, Mon. Fungus genus Cercospora p. 58, 1953.
Syn.: *Cercospora caladii* Cooke var. *colocasiae* v. Höhnel, Sitzungsber. k. Akad. Wiss. Wien 116, 150, 1907.
on *Alocasia macrorhiza*.
Java, Bogor June 1950 B.
Cercospora alocasiae Sawada, Taiwan Agr. Rev. 38, 693, 1942 found on the same host, is described as possessing hyaline acicular conidia. Our material however shows pale olivaceous obclavato-cylindric conidia, 52–100×3–4 μ, and also in all other characters neatly agrees with the description as given by Chupp.
Cercospora extremorum Syd., Ann. Mycol. 15, 264, 1917.
on *Homalomena rubra* and on *Araceae* prob. *Homalomena*.
Java, Hortus Bogoriensis Aug. 1950, Djasinga Jan. 1955 B.
Cercospora protensa Syd., Ann. Mycol. 28, 446, 1930.
on *Amorphophallus variabilis* and *Amorphophallus* spec.
Java, Hortus Bogoriensis June 1941, June 1953 B. Bogor Jan. 1950 B. Pasar Mingu March 1950 B.
This species is very different from *Cercospora amorphophalli* Henn. It forms effuse, olivaceous patches on the underside of the leaves, often occupying large areas. The conidia are mostly strongly bent.
Cercospora rhichardiaecola Atkinson, Journ. Elisha Mitchell Sc. Soc. 8, 51, 1892.
on *Zantedeschia* spec. (*Richardia*).
Java, Hortus Bogoriensis June 1950 B.

ARALIACEAE

Cercospora panacis Thirumalachar et Chupp, Mycologia 40, 358, 1948.
on *Nothopanax primatum* and *Nothopanax* spec.
Java, Hortus Bogoriensis Dec. 1949, May 1950 B.

CERCOSPORA SCHEFFLERAE Boedijn nov. spec. (fig. 2)

Maculae orbiculares, pallide brunneae, zonula edita cinctae. 1–2 mm diam. Caespituli amphigeni. Stromata minuta, subglobosa, fusca 10–40 μ diam. Conidiophora 5–20 diverse fasciculata, pallide olivaceo-brunnea, sursum pallidiora, parce septata, vix ramosa et geniculata, ad apicem subtruncata, 40–70×3–4 μ. Conidia pallide olivacea, subcylindrica, recta vel leniter curvata, obscure 3–7 septata, ad basim subtruncata, ad apicem subrotundata 25–51×2½–4 μ, plerumque 32–37×3–3½ μ.

Leafspots orbicular, pale brown, with strongly raised border, 1–2 mm in diameter. Fruiting amphigenous. Stromata filling substomatal airspace, small, subglobular, dark brown, 10–40 μ in dia-

meter. Fascicles in groups of 5 to 20 or more stalks, divergent. Conidiophores pale brown, subhyaline towards the tips, sparingly septate, seldom branched, weakly geniculate tip subconic, 40–70×3–4 μ. Conidia pale olivaceous, almost cylindric straight to slightly curved, indistinctly 3–7 septate, base obconic, tip rounded, 25–51×2½–4 μ, mostly 32–37×3–3½ μ.
on *Schefflera obovata*.
Java, Hortus Bogoriensis Aug. 1953B.

BALSAMINACEAE

Cercospora Fukushiana (Matsuura) Yamamoto, Journ. Plant Prot. 14, 699, 1929.
Syn.: *Cercosporina Fukushiana* Matsuura, Trans. Tattori Soc. Agr. Sc. Japan 1, 83, 1928.
Cercospora balsaminae Mendoza, Philipp. Journ. Sc. 75, 166, 1941.
on *Impatiens* spec.
Java, Hortus Bogoriensis April 1950B.

BIGNONIACEAE

CERCOSPORA RADERMACHERAE Boedijn nov. spec. (fig. 3)

Maculae suborbiculares vel angulatae, pallide brunneae vel griseae, 1–5 mm. diam. Caespituli amphigeni. Stromata fere deficiens. Conidiophora fasciculata, olivaceo-brunnea, septata non ramosa et geniculata, interdum leviter undulata, ad apicem subtruncata, 24–80×2–3 μ. Conidia hyalina, obclavata, recta vel leniter curvata, spurie multiseptata, ad basim subtruncata, ad apicem subacuta, 32–58×2–3 μ, plerumque 40–50×2½ μ.

Leafspots subcircular to angular, pale brown to pale gray, 1–5 mm. in diameter. Fruiting amphigenous. Stromata slight. Fascicles fairly dense. Conidiophores brown, unbranched, septate, not geniculate, sometimes weakly undulating, tip bluntly rounded, 24–80×2–3 μ. Conidia hyaline, obclavate, straight to slightly curved, indistinctly multiseptate, base obconic, tip subacute 32–58×2–3 μ, mostly 40–50 ×2½ μ.
on *Radermachera glandulata*.
Java, Hortus Bogoriensis July 1950B.

CARICACEAE

Cercospora papayae Hansford, Proc. Linn. Soc. London 42/43, 58, 1943.

on *Carica papaya* and *Carica monoica*.
Java, Patjet June 1950 Reitsma.

CHENOPODIACEAE

Cercospora beticola Sacc., Nuov, Giorn. Bot. Ital. 8, 189, 1876.
Syn.: *Cercospora betae* Frank, Krankh. d. Pflanze p. 601, 1880.
Cercospora longissima Cooke et Ellis, Grevillea 17, 65, 1889.
Cercospora flagelliformis E. et H., N. Jer. Ann. Rept. 1890, p. 355, 1891.
Cercospora anthelmintica Atkinson, Journ. Elisha Mitchell Sc. Soc. 8, 49, 1892.
Cercospora spinaciae Oudemans, Nederl. Kruidk. Arch. iii, 2, 314, 1900.
Cercospora chenopodiicola Bres., Hedwigia 39, 328, 1900.
Cercosporina spinacicola Sacc., Nuov. Giorn. Bot. Ital. n.s. 22, 73, 1915.
on *Beta vulgaris* and *Beta chiliensis*.
Java, Bogor April 1943 Reitsma, Nov. 1948B. Tjipanas Febr. 1950 Nieuwstraten.

COCHLOSPERMACEAE

Cercospora cochlospermi Baker et Dale, Mycol. Papers Commonwealth Mycol. Inst. 33, 101, 1951.
on *Cochlospermum* spec.
Java, Hortus Bogoriensis April 1950B.

COMBRETACEAE

CERCOSPORA COMBRETI Boedijn nov.spec. (fig. 4)

Maculae indeterminatae, pallide brunneae, confluentes et saepe fere totam folii marginam obtegentis. Caespituli epiphylli. Stromata subglobosa, atro fuliginea, 30–50 μ diam. Conidiophora densissime fasciculata, olivaceo-brunnea, sursum pallidiora, vix septata, parce ramosa et geniculata, interdum undulata, ad apicem subacuta 60–100×3–4 μ. Conidia subhyalina vel pallidissime olivacea, obclavata, vel cylindro-obclavata, recta vel leniter curvata, spurie 3–7 septata, ad basim subtruncata, ad apicem subacuta, 40–68×3–4 μ, plerumque 50–60×3½ μ.

Leafspots undefinite, pale brown, coalescing and covering much of the leafmargin. Fruiting epiphyllous, Stromata subglobular, blackish brown, 30–50 μ in diameter. Fascicles very dense. Conidiophores olive brown, paler towards the tip, sparingly septate, sometimes undulating,

seldom branched, weakly geniculate, tip subacute, 60–100×3–4 μ. Conidia subhyaline to weakly colored, obclavate to cylindro-obclavate, straight to slightly curved, indistinctly 3–7 septate, base obconic, tip subacute, 40–68×3–4 μ, mostly 50–60×3½ μ.

on *Combretum* spec.

Java, Hortus Bogoriensis July 1950B.

Cercospora catappae Henn., in Engler's Bot. Jahrb. 34, 56, 1905.

Syn.: *Cercospora terminaliae* Sawada, Formosa Agr. Rev. 38, 701, 1942.

on *Terminalia catappa.*

Pulu Sertung Jan. April 1933B.

COMPOSITAE

Cercospora bidentis Tharp, Mycologia 9, 108, 1917.

Syn.: *Cercospora bidentis* Marchal et Steyaert, Bull. Soc. R. Bot. Belg. 61, 167, 1929.

on *Bidens pilosus.*

Java, Bogor Aug. 1949B.

In this material leafspots 1–3 mm. in diameter, almost white with a dark margin. On the underside pale brown, with raised border.

Cercospora eupatorii Peck, N.Y. State Mus. Nat. Hist. Ann. Rept. 33, 29, 1880.

on *Eupatorium odoratum.*

Java, Hortus Bogoriensis April 1950B.

Cercospora lactucae-sativae Sawada, Formosa Agr. Res. Inst. Rept. 35, 111, 1928.

Syn.: *Cercospora longissima* (Cugini in Herb.) Sacc., Syll. Fung. 18, 607, 1906 (non *C. longissima* Cooke et Ellis).

Cercospora lactucae Stevenson, Journ. Dept. Agr. Puerto Rico 1, 105, 1917.

Cercospora lactucae Welles, Phytopathology 13, 289, 1923.

Cercospora ixeridis-chinensis Sawada, Formosa Agr. Res. Inst. Rept. 86, 171, 1943.

Cercospora lactucae-indicae Sawada, Formosa Agr. Res. Inst. Rept. 86, 172, 1943.

on *Lactuca sativa.*

Java, Bogor, May, July 1943B.

Chupp in his monograph of the genus *Cercospora* uses the name *C. longissima* (Cugini in Herb.) Sacc. for our species. But as there already exist a *C. longissima* Cooke et Ellis, I am obliged to reject this name.

CONVOLVULACEAE

Cercospora timorensis Cooke, Grevillea 12, 38, 1883.
Syn.: *Cercospora batatae* Zimm., Ber. Land. Forstw. Deutsch Ostafrika 2, 28, 1904.
Cercospora batatae Henn., in Engler's Bot. Jahrb. 38, 118, 1907.
on *Ipomoea batatas* and *Ipomoea cymosa*.
Java, Bogor Nov. 1949B. July 1950 Reitsma.
Timor-laut June 1883 Riedel.
Cercospora ipomoeae Winter, Hedwigia 26, 34, 1887.
Syn.: *Cercospora virudula* Ellis et Everh., Journ. Mycol. 5, 70, 1889.
Cercospora alabamensis Atkinson, Journ. Elisha Mitchell Sc. Soc. 8, 51, 1892.
Cercospora stuckertiana Syd., Mém. Herb. Boissier 8 (4) 2, 1900.
on *Operculina turpethum* and *Operculina* spec.
Krakatau April 1933B. Java, Hortus Bogoriensis April, June, Aug. 1950B.

Though our material is growing on *Operculina*, it is not identical with *Cercospora operculina* Mendoza, Philipp. Journ. Sc. 75, 174, 1941, which according to the description is a wholly different species.

CRASSULACEAE

CERCOSPORA KALANCHOES Boedijn nov. spec. (fig. 5)

Maculae suborbiculares, pallide brunneae, plerumque zonula obscura cinctae, 2–10 mm. diam. Caespituli epiphylli. Stromata parva, fusca 14–38 μ diam. Conidiophora laxe fasciculata, olivaceo-brunnea, sursum palidiora non ramosa, parce septata et geniculata, ad apicem subtruncata, 40–96 × 3–4½ μ. Conidia hyalina, obclavata vel anguste obclavata, recta vel leniter curvata, spurie multiseptata, ad basim truncata, ad apicem acuta 90–173 × 2½–4 μ, plerumque 96–104 × 3 μ.

Leafspots subcircular, pale brown, mostly with a dark border, 2-3 mm., afterwards up to 10 mm. in diameter. Fruiting especially epiphyllous. Stromata rather small, dark brown, 14–38 μ in diameter. Fascicles in groups of 3 to 10 stalks. Conidiophores brown, a triffle paler towards the tip, unbranched, sparingly septate and geniculate, tip conic to bluntly rounded, 40–96×3–4½ μ. Conidia hyaline, obclavate to almost acicular, straight to slightly curved, indistinctly multiseptate, base truncate, tip acute, 90–173×2½–4 μ, mostly 96–104×3 μ.
on *Kalanchoe* spec.
Java, Hortus Bogoriensis March 1950B.

CUCURBITACEAE

Cercospora citrullina Cooke, Grevillea 12, 31, 1883.
Syn.: *Cercospora cucurbitae* Ellis et Everh., Journ. Mycol. 4, 3, 1888.
Cercospora sechii Stevenson, P. Rico Ins. Exp. Stat. Dept. Agr. Ann. Rept. 1917, 18, 137, 1919.
Cercospora luffae Hara, Diseases of cultivated plants p. 228, 1928.
Cercospora momordicae McRea, Ann. Crypt. exotique 2, 267, 1929.
Cercospora trichosanthis McRea, Ann. Crypt. exotique 2, 270, 1929.
Cercospora chardoniana Chupp, Mon. Univ. P. Rico B. 2, 245, 1934.
Cercospora momordicae Mendoza, Philipp. Journ. Sc. 75, 173, 1941.
Cercospora momordicae Sawada, Formosa Agr. Res. Inst. Rept. 86, 173, 1943.
on *Momordica charantia* and *Luffa* spec.
Java, March 1942, July 1943 B.

CYPERACEAE

Cercospora cyperi-rotundi Thirumalachar et Govindu, Sydowia 7, 312, 1953.
on *Cyperus rotundus.*
Java, Lawang Bedali May 1950 v. Hoof.

DIOSCOREACEAE

Cercospora ubi Rac., Par. Alg. u. Pilze Java's 3, 39, 1900.
Syn.: *Cercospora brasiliensis* Averna, Bol. Agr. Sao Paulo 18 A 7, 580, 1917.
on *Dioscorea alata*, *Dioscorea bulbifera* and *Dioscorea* spec.
Java, Bogor R. Hortus Bogoriensis April 1950 B.
Cercospora dioscoreae Ellis et Martin, Amer. Nat. 16, 1003, 1882.
Syn.: *Cercospora nubilosa* Ellis et Everh., Journ. Mycol. 4, 115, 1888.
Cercospora tokoroi Togashi, Imp. College Agr. Forst. Morioka Bul. 22, 46, 1936.
on *Dioscorea hispida.*
Java, Bogor Jan. 1950 B. Pasar Mingu March 1950 v. Hoof.
Cercospora carbonacea Miles, Trans. Jll. Acad. Sc. 10, 255, 1917.
on *Dioscorea* spec.
Java, Hortus Bogoriensis April 1950 B.

ELAEOCARPACEAE

Cercospora muntingiae Petrak et Ciferri, Ann. Mycol. 30, 324, 1932.
on *Muntingia calabura.*
Java, Bogor Febr. 1950 B.

EUPHORBIACEAE

Cercospora Henningsii Allescher, in Engler's Pflanzenwelt Ost Afrikas, Teil C p. 35, 1895.
Syn.: *Cercospora cassavae* Ellis et Everh., Bull. Torrey Bot. Club 22, 438, 1895.
Cercospora manihotis Henn., Hedwigia 41, Beibl. 18, 1902.
Septogloeum manihotis Zimm., Centralbl. Bakt. etc. Abt. 2, 8, 218, 1902.
Cercospora cearae Petch, Ann. R. Bot. Garden Peradeniya 3, 10, 1906.

on *Manihot utilissima.*
Sumatra, Sungai Pantjur Febr. 1926 B.
Java, Bogor Aug. 1922, June 1941 B.
Cercospora ricinella Sacc. et Berl., Atti R. Ist. Ven. Sc. Lett. Arti VI, 3, 721, 1885.
Syn.: *Cercospora albido-maculans* Winter, Hedwigia 24, 202, 1885.
Cercospora ricini Speg., Anal. Mus. Nac. B. Aires ser. 2, 3, 343, 1899.
Cercosporina ricinella (Sacc. et Berl.) Speg., Anal. Mus. Nac. B. Aires 20, 429, 1910.
on *Ricinus communis.*
Sumatra, Kampong Baru April 1926 B.
Cercospora tiglii Henn., Hedwigia 47, 265, 1908.
Syn.: *Cercospora trinidadensis* Stevens et Solheim, Mycologia 23, 376, 1931.
on *Croton tiglium.*
Java, Hortus Bogoriensis Febr. 1942, Nov. 1950 B. Bogor, Dec. 1949 B.

GRAMINEAE

Cercospora Koepkei Krüger, Ber. Versuch. Stat. Zuckerr. W. Java 1, 115, 1890.
Syn.: *Cercospora longipes* Butler, Dept. Agr. India Mem. 1, 41, 1906.
on *Saccharum officinarum.*

Java, Kagok Tegal W. KRÜGER.
Cercospora vaginae KRÜGER, Ber. Versuch. Stat. Zuckerr. W. Java 1, 64, 1890.
on *Saccharum officinarum.*
Java, Kagok Tegal W. KRÜGER.
Cercospora sorghi ELLIS et EVERH., Journ. Mycol. 3, 15, 1887.
on *Sorghum* spec.
Java, Bogor May 1950 v. HOOF.

LABIATAE

CERCOSPORA COLEI BOEDIJN nov. spec. (fig. 6)

Maculae suborbiculares vel elongatae, fere albidae, zonula obscura cinctae, ½–1 mm. diam. Caespituli epiphylli. Stromata subglobosa, brunnea, 20–45 μ diam. Conidiophora laxe fasciculata, pallide olivaceo-brunnea, sursum pallidiora, haud septata, geniculata, ad apicem subtruncata 20–50 × 3½–4½ μ. Conidia hyalina, obclavata vel anguste obclavata, leniter curvata, spurie multiseptata, ad basim truncata, ad apicem acuta 56–78 × 3–4 μ, plerumque 60–70 × 3½ μ.

Leafspots subcircular to somewhat elongated, nearly white with dark border, ½–1 mm. in diameter. Fruiting chiefly epiphyllous. Stromata subglobular, brown, 20–45 μ in diameter. Fascicles in groups of a few to about 20 stalks. Conidiophores slightly colored, paler towards the tips, not septate, geniculate, tip bluntly rounded, conidial scars distinct, 20–50 × 3½–4½ μ. Conidia hyaline, narrowly obclavate to almost acicular, slightly curved, indistinctly multiseptate, base truncate, tip acute, 56–78 × 3–4 μ, mostly 60–70 × 3½ μ.
on *Coleus atro-purpureus* and *Coleus hybridus.*
Java, Bogor July 1949 v. HOOF, Hortus Bogoriensis May 1950 B.

LAURACEAE

CERCOSPORA LITSEICOLA BOEDIJN nov. spec. (fig. 7)

Maculae suborbiculares vel irregularis, fere nigrae, postea centro griseae, 1–5 mm. diam. Caespituli epiphylli. Stromata globosa, fusca 50–150 μ diam. Conidiophora dense fasciculata, pallide olivaceo-brunnea, sursum pallidiora, non ramosa, parce septata, haud geniculata, ad apicem subtruncata, 20–40 × 2–3 μ. Conidia pallidissime olivacea, anguste obclavata vel cylindro-obclavata, leniter curvata, spurie multiseptata, ad basim subtruncata, ad apicem acuta, 49–128 × 2½–3½ μ, plerumque 56–72 × 3 μ.

Leafspots subcircular to irregular, nearly black, later with gray center, 1–5 mm. in diameter. Fruiting epiphyllous. Stromata prominent, globular, dark brown, 50–150 μ in diameter. Fascicles dense.

Conidiophores pallid brown, paler towards the tip, unbranched, sparingly septate, not geniculate, tip bluntly rounded, 20–40×2–3 μ. Conidia very pale colored, narrowly obclavate to cylindro-obclavate, mildly curved, indistinctly multiseptate, base obconic, tip acute 49–128×2½–3½ μ, mostly 56–72×3 μ.
on *Litsea* spec.
Java, Hortus Bogoriensis April 1950 B.

LEGUMINOSAE

CERCOSPORA ABRICOLA Boedijn nov. spec. (fig. 8)

Maculae typicae nullae, sed decolorationes flavido-viridas usque ad 1 mm. diam. efficiens. Caespituli semper epiphylli. Stromata subglobosa, fusca 20–60 μ diam. Conidiophora densiuscula fasciculata, fuliginea, sursum pallidiora, non ramosa, parce septata, geniculata et undulata, ad apicem circiter subtruncata 21–70×3–5 μ. Conidia hyalina, obclavata, recta, spurie 1–5 septata, ad basim subtruncata, ad apicem subrotundata, 21–56×3½–5 μ, plerumque 36–40×4 μ.

Leafspots hardly visible, indistinctly yellowish green, up to 1 mm. in diameter. Fruiting epiphyllous. Stromata subglobular, dark brown, 20–60 μ in diameter. Fascicles dense. Conidiophores brown, pale towards the tip, unbranched, geniculate, undulate, sparingly septate, tip more or less conic, 21–70×3–5 μ. Conidia hyaline, obclavate, straight, indistinctly 1–5 septate, base obconic, tip rounded 21–56×3½–5 μ, mostly 36–40×4 μ.
on *Abrus precatorius*.
Java, Hortus Bogoriensis July 1953 B.
Cercospora arachidicola Hori, Nishigahara Agr. Exp. St. Tokyo Ann. Rep. p. 26, 1917.
Syn.: *Cercospora arachidis* Henn. var. *macrospora* Maffei, Riv. Pat. Veget. 12, 7, 1922.
on *Arachis hypogaea*.
Java, Bogor April 1949 v. Hoof.

This species grows often together with *Cercospora personata* on the same leaves. Microscopically it is very different from the latter.
Cercospora personata (Berk. et Curt.) Ellis et Everh., Journ. Mycol. 1, 63, 1885.
Syn.: *Cladosporium personatum* Berk. et Curt., Grevillea 3, 106, 1875.

Cercospora erythrinicola Tharp, Mycologia 9, 109, 1917.
Syn.: *Cercosporina erythrinicola* (Tharp) Sacc. Syll. Fung. 25, 907, 1931.
on *Erythrina* spec.
Java, Bogor Aug. 1949 B.
The hyaline conidia in this material are 52–206×2½–3 μ.

Cercospora gliricidiae Syd., Philipp. Journ. Sc. 8, 283, 1913.
on *Gliricidia maculata.*
Java, Hortus Bogoriensis May 1954 B.
Chupp (5) mentions for this species dark colored, thick walled conidia 1–3 septate measuring 20–50×5–9 μ. Therefore he will exclude this species from the genus *Cercospora.* But I assume that he did not see the type, for our material neatly agrees with the description as given by Sydow. The pale colored, thin walled conidia, indistinctly multiseptate are measuring 44–52×3½–5 μ. The measurements in the original description are 40–75×4–5½ μ.

Cercospora stizolobii Syd., Ann. Mycol. 11, 270, 1913.

MAGNOLIACEAE

CERCOSPORA MICHELIAE Boedijn nov. spec. (fig. 9)

Maculae suborbiculares, griseae, linea obscuriore limitatae, 2–5 mm. diam. mox autem confluentes et saepe fere totam folii paginam omnino obtegentis. Caespituli amphigeni. Stromata fere deficiens. Conidiophora unica vel fasciculata, pallide olivaceo-brunnea, sursum pallidiora, parce septata, ad apicem subtruncata 7–36 × 3½–4½ μ. Conidia pallidissime olivacea, anguste obclavata, recta vel leniter curvata, spurie multiseptata, ad basim subtruncata ad apicem subacuta 40–91 × 3–4 μ, plerumque 70–80 × 3½ μ.

Leafspots at first subcircular, gray with dark margin, 2–5 mm. in diameter, later by coalescing irregular and sometimes covering much of the leaf surface. Fruiting amphigenous but especially hypophyllous. Stromata slight or none. Conidiophores borne singly or in fascicles on procumbent, intertwining hyphae, which are branched, septated, pale brown in color and 1½–3 μ broad. They are pale brown, subhyaline towards the tips, seldom septate, tip bluntly rounded 7–36 × 3½–4½ μ. Conidia very pale colored, narrowly obclavate, straight or mostly mildly curved, indistinctly multiseptate, base obconic, tip rounded to subacute, 40–91 × 3–4 μ, mostly 70–80 × 3½ μ.
on *Michelia champaca* and *Michelia* spec.
Java, Hortus Bogoriensis April, May 1950 B.

MALVACEAE

on *Hibiscus esculentus*.
Java, Bogor 1943 Reitsma.

MARATTIACEAE

CERCOSPORA ANGIOPTERIDIS Boedijn nov. spec. (fig. 10)

Maculae angulatae vel irregularis, 2–9 mm. longae, saepe confluentes, fuscae. Caespituli epiphylli. Stromata globosa, atro-fusca, 20–40 μ diam. Conidiophora densiuscule fasciculata, pallide olivaceo-brunnea, sursum pallidiora, septata, parce geniculata, saepe interdum constricta, ad apicem subtruncata, 30–96 × 3–4 μ. Conidia subhyalina, obclavata, leniter curvata, spurie multiseptata, ad basim subtruncata ad apicem subacuta, 42–69 × 3–4 μ, plerumque 50–60 × 3–3½ μ.

Leafspots typically along the border of the pinnae, irregular triangular, 2–9 mm. long, often coalescing and consequently much longer. Color dark brown, large blotches with paler center. Fruiting epiphyllous. Stromata globular, blackish brown, 20–40 μ in diameter. Fascicles dense. Conidiophores pale brown, paler towards the tip, septate,

sparingly geniculate, often with slight constrictions, tip conic till bluntly conic, 30–96×3–4 μ. Conidia subhyaline, obclavate, mildly curved, indistinctly multiseptate, base obconic, tip rounded to subacute, 42–69×3–4 μ, mostly 50–60×3–3½ μ.
on *Angiopteris evecta*.

on *Nycthantes arbor tristis*.
Java, Bogor Oct. 1949B. Hortus Bogoriensis April 1950B.

RANUNCULACEAE

CERCOSPORA CLEMATIDIS Boedijn nov. spec. (fig. 11)

Maculae angulatae, plerumque venulis limitatae, atro-brunneolae, 1–8 mm. longae. Caespituli hypophylli. Stromata minutissima. Conidiophora 2–20 fasciculata, vel unica, olivaceo-brunnea, septata, parce ramosa, geniculata, undulata, 21–94×3–4 μ. Conidia hyalina, anguste obclavata, recta vel leniter curvata, spurie 3–7 septata, ad basim subtruncata ad apicem acuta, 48–84×2½–3½ μ, plerumque 60–70×3 μ.

Leafspots typical angular, limited by leafveins, almost black in color, 1–8 mm. in length. Fruiting especially hypophyllous. Stromata slight, consisting mostly of a number of moderately thickwalled brown cells. Fascicles in groups of 2 to about 20 divergent stalks, sometimes also short branches spaced at short intervals on procumbent threads. Conidiophores brown throughout their entire length, septated, sparingly branched, geniculate, undulating 21–94×3–4 μ. Conidia hyaline, acicular, straight or slightly curved, indistinctly 3–7 septate, base obconic, tip acute 48–84×2½–3½ μ, mostly 60–70×3 μ.
on *Clematis zeylanica*.
Java, Hortus Bogoriensis May 1950B.

ROSACEAE

Cercospora mali Ellis et Everh., Journ. Mycol. 4, 116, 1888.
on *Pirus malus*.
Java, Patjet Nov. 1949 v. Hoof.

RUBIACEAE

CERCOSPORA CINCHONICOLA Boedijn nov. spec. (fig. 12)

Maculae fuscae, irregulares, 2–3 mm. longae saepe confluentes. Caespituli hypophylli. Stromata parva, applanata, atro-fusca 15–40 μ diam. Conidiophora fasciculata, olivaceo-brunnea, sursum pallidiora, ramosa, parce septata, geniculata ad apicem subrotundata, 20–60×3–3½ μ. Conidia pallide olivacea, obclavata, leniter curvata, spurie multiseptata, ad basim subtruncata ad apicem subacuta, 64–110×3–4 μ, plerumque 70–75×3 μ.

Leafspots irregular in outline, brown, 2–3 mm. in length by coalescing much larger. Fruiting chiefly hypophyllous. Stromata small, flattened, blackish brown 15–40 μ in diameter. Fascicles fairly dense. Conidiophores brown, slightly paler at the tip, often provided here with a short side branch, sparingly septate, geniculate, tip bluntly rounded 20–60×3–3½ μ. Conidia pale olivaceous, narrowly obclavate, mildly curved, indistinctly multiseptate, base obconically truncate, tip rounded to subacute 64–110×3–4 μ, mostly 70–75×3 μ.

on *Cinchona* spec.

Java, Patjet Aug. 1950 Tojib Hadiwidjaja.

Cercospora coffeicola Berk. et Cooke, Grevillea 9, 99, 1881.

Cercospora Herrerana Farn., Atti Inst. Bot. R. Univ. Pavia ser. 2, 9, 37, 1911.

on *Coffea* spec.

Java.

CERCOSPORA GARDENIAE Boedijn nov. spec. (fig. 13)

Maculae orbiculares, pallide brunneae, 5–10 mm. diam. Caespituli amphigeni. Stromata minuta vel nulla. Conidiophora fasciculata, pallide olivaceo-brunnea, sursum pallidiora, vix septata et ramosa, ad apicem subtruncata 12–40×2½–3½ μ. Conidia pallidissime olivacea, fere anguste obclavata, recta vel leniter curvata, spurie multiseptata, ad basim subtruncata, ad apicem subacuta 53–78×2½–4 μ, plerumque 60–70×3 μ.

Leafspots orbicular, dull brown, 5–10 mm. in diameter. Fruiting amphigenous. Stromata slight or none. Fascicles fairly dense. Conidiophores pale brown, subhyaline towards the tip, seldom with a septum or a side branch, tip conic 12–40×2½–3½ μ. Conidia very pale colored, more or less acicular, straight or slightly curved, indistinctly multiseptate, base obconic, tip rounded to subacute 53–78×2½–4 μ, mostly 60–70×3 μ.

on *Gardenia jasminoides*.

CERCOSPORA MITRAGYNES Boedijn nov. spec. (fig. 14)

Maculae irregulares, brunneae 2–4 mm. longae, saepe confluentes et multo majores. Caespituli epiphylli. Stromata minuta, subglobosa, fusca 12–35 μ diam. Conidiophora fasciculata, pallide olivaceo-brunnea, sursum pallidiora, haud septata et ramosa, parce geniculata, ad apicem rotundata 10–36×1½–2½ μ. Conidia pallidissime olivacea, fere anguste obclavata, recta vel leniter curvata, spurie 2–6 septata, ad basim subtruncata ad apicem subacuta 30–70×2–3 μ, plerumque 40–48×2½ μ.

Leafspots irregular, brown 2–4 mm. in length, by coalescing often much larger. Fruiting especially epiphyllous. Stromata weakly developed, subglobular, dark brown 12–35 μ in diameter. Fascicles fairly dense. Conidiophores pale brown, nearly hyaline towards the tip, not septate, unbranched, hardly geniculate, tip rounded 10–36×1½–2½ μ. Conidia very pale colored, almost acicular, straight to slightly curved, indistinctly 2–6 septate, base obconic, tip subacute 30–70×2–3 μ, mostly 40–48×2½ μ.
on *Mitragyne* spec.

Java, Pasar Minggu near Djakarta Nov. 1948 B.

CERCOSPORA EVODIICOLA Boedijn nov. spec. (fig. 15)

Maculae irregulares, angulatae, plerumque venulis limitatae, pallidissime brunneae vel griseae, 2–5 mm. longae, saepe confluentes et multo majores. Caespituli amphigeni. Stromata subglobosa vel applanata, atro-fusca, 16–48 μ diam. Conidiophora olivaceo-brunnea, sursum pallidiora, septata, ramosa, parce geniculata, interdum undulata, ad apicem subtruncata 15–92×3½–5 μ. Conidia hyalina, obclavato-cylindrica, recta vel leniter curvata, spurie 3–7 septata, ad basim subtruncata, ad apicem subacuta 33–64×3–4 μ plerumque 36–40×3–3½ μ.

Leafspots irregular, angular and partly vein bound, very pale brown to pale gray 2–5 mm. long, by coalescing often larger. Fruiting amphigenous. Stromata subglobose to flattened, blackish brown 16–48 μ in diameter. Fascicles dense. Conidiophores brown, paler towards the tip, septate, branched, sparingly geniculate, sometimes undulate, tip conic to bluntly rounded 15–92×3½–5 μ. Conidia hyaline, obclavato-cylindric, straight to slightly curved, indistinctly 3–7 septate, base obconic, tip rounded 33–64×3–4 μ, mostly 36–40×3–3½ μ.
on *Evodia Ridleyi* and *Evodia* spec.

STEMONACEAE

CERCOSPORA STEMONAE Boedijn nov. spec. (fig. 16)

Maculae suborbiculares vel elongatae, fere albidae, zonula obscuriore limitatae, 1–3 mm. diam. per confluentes multo majores. Caespituli amphigeni. Stromata applanata, fusca 20–50 μ diam. Conidiophora fasciculata, pallide olivaceo-brunnea, sursum pallidiora, vix septata et geniculata, ad apicem subtruncata 16–50×3–4½ μ. Conidia pallide olivacea, cylindro-obclavata, recta vel leniter curvata, evidenter 5–14 septata, plerumque 7 septata, ad basim subtruncata, ad apicem subrotundata vel subacuta 58–104×3½–4½ μ, plerumque 68–72×4 μ.

Leafspots subcircular to elongated, nearly white with a broad dark border, 1–3 mm. in diameter, by coalescing often much larger. Fruiting amphigenous. Stromata somewhat flattened, dark brown 20–50 μ in diameter. Fascicles fairly dense. Conidiophores pale brown with subhyaline tip, mostly not septate, nor geniculate, tip subconic 16–50× 3–4½ μ. Conidia pale olivaceous, cylindro-obclavate, straight or slightly curved, distinctly 5–14 septate, mostly 7 septate, base obconic, tip more or less rounded to subacute, 58–104×3½–4½ μ, mostly 68–72×4 μ.

Java, Hortus Bogoriensis May, Aug. 1950 B.

A species well marked by its long conidia, which in this material are 140–200×4–5 μ.

CERCOSPORA PREMNICOLA Boedijn nov. spec. (fig. 17)

Maculae indeterminatae, pallide brunneae, 4–10 mm. longae, saepe confluentes et multo majores. Caespituli hypophylli, effusi. Stromata deficiens. Conidiophora unica, olivaceo-brunnea, interdum ramosa, septata, geniculata et flexuosa, ad apicem subtruncata 10–60×3–5 μ. Conidia pallide olivacea, obclavato-cylindrica vel fere cylindrica, leniter curvata, evidenter 6–12 septata, ad basim truncata ad apicem subobtusa 96–160×3–4 μ, plerumque 112–120×3½ μ.

Leafspots indefinite, often running along the veins, pale brown, 4–10 mm. long, by coalescing much larger. Fruiting hypophyllous, effuse. Stromata lacking. Conidiophores brown, sometimes branched, septate, geniculate and often tortuous, tip bluntly rounded, 10–60× 3–5 μ, borne as erect branches spaced at rather short intervals on procumbent threads. Those hyphae pale brown, branched, septated 1½–3½ μ broad. Conidia pale olivaceous obclavato-cylindric to almost cylindric, slightly curved, distinctly 6–12 septate, base truncate, tip rounded 96–160×3–4 μ, mostly 112–120×3½ μ.

ZINGIBERACEAE

CERCOSPORA HEDYCHII Boedijn nov. spec. (fig. 18)

Maculae indeterminatae, pallide griseo-brunneolae. Caespituli amphigeni. Stromata absunt vel minuta. Conidiophora fasciculata vel unica, ad basim pallide brunnea in superiore parte subhyalina, parce ramosa, raro septata et geniculata, ad apicem subtruncata 6–52×2–3 μ. Conidia hyalina, anguste obclavata, recta vel leniter curvata, spurie multiseptata 41–70×2–3 μ, plerumque 50–60×2½ μ.

Leafspots especially along the border and tip of the leaf, pale brownish gray in color, soon coalescing and indefinite in shape and dimensions. Fruiting amphigenous. Stromata slight or none. Fascicles rather dense, but also isolated branches on procumbent threads present. Conidiophores showing a brown color only at the base, where they are densely grouped. Rest of thread subhyaline, very rarely branched, mostly unseptated, weakly geniculate, tip conic 6–52×2–3 μ. Conidia hyaline, acicular, straight or slightly curved, indistinctly multiseptate 41–70×2–3 μ, mostly 50–60×2½ μ.
on *Hedychium coccineum*.
Java, Hortus Bogoriensis June 1950 B.

CERCOSPORA NICOLAIAE Boedijn nov. spec. (fig. 19)

Maculae indeterminatae, pallide griseo-brunneolae, saepe zonula brunnea cinctae, subinde confluendo et totam folii omnino obtegentes. Caespituli amphigeni. Stromata minuta. Conidiophora plerumque densiuscule fasciculata, olivaceo-brunnea, septata, non ramosa, vix geniculata, undulata, ad apicem subtruncata 30–140×2½–4 μ. Conidia hyalina, anguste obclavata, recta vel leniter curvata, spurie 3–6 septata, ad basim subtruncata ad apicem subacuta 40–87×2½–4 μ, plerumque 56–64×3 μ.

Leafspots indefinite, pale grayish brown, sometimes with a brown margin, later large blotches covering much of the leaf surface. Fruiting amphigenous. Stromata slight. Fascicles in bundles of parallel threads, sometimes very dense, resembling almost coremia. Conidiophores brown throughout their entire length, richly septated, not branched, hardly geniculate, wall often undulating, tip conic 30–140×2½–4 μ. Conidia hyaline, narrow obclavate, straight or slightly curved, indistinctly 3–6 septate, base subtruncate, tip subacute 40–87×2½–4 μ, mostly 56–64×3 μ.
on *Nicolaia* spec.
Java, Bogor Febr. 1949 B.

EXCLUDED SPECIES

Cercospora acerosum Dickhoff et Hein, Arch. Java Suikerindustr. 9, 1009, 1901.

on *Saccharum officinarum*.
Java, Pasuruan.
Description wholly insufficient.
Cercospora undulata (BERNARD) SACC., Syll. Fung. 22, 1415, 1913.
Syn.: *Ramularia undulata* BERNARD Bull. Dept. Agr. Ind. Néerl. Buitenzorg 11, 47, 1907.
on *Aglaia odorata*.
Java, Bogor BERNARD.
According to CHUPP, this is most probably a *Helminthosporium*.
Cercospora villebruneae v. HÖHNEL, Sitzungsber. K. Akad. Wiss. Wien 121, 413, 1912.
on *Villebrunea sylvatica*.
Java, Hortus Bogoriensis 1907 v. HÖHNEL.
According to CHUPP this may be an *Alternaria*.
